JS-quence 18, Application US/09903456

Patent No. 6677145

GENERAL INFORMATION:

APPLICANT: Abbott Laboratories

APPLICANT: Huang, Yung-Sheng

CURRENT HILD OF INVENTION: ELONGASE GENES AND USES THEREOF

FILE REFERENCE: 6407.US.P3

CURRENT FILING DATE: 2001-07-11

PRIOR APPLICATION NUMBER: US 09/624,670

PRIOR APPLICATION NUMBER: US 09/379,095

PRIOR APPLICATION NUMBER: US 09/145,828

PRIOR FILING DATE: 1999-08-23

PRIOR FILING DATE: 1998-09-02

NUMBER OF SEQ ID NOS: 116

SOFTWARE: FABELSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 37; DB 4; Le

Sequence 3, Application US/10764328

Publication No. US20040166521A1

GENERAL INFORMATION:
APPLICANT: PXE International, Inc.
TITLE OF INVENTION: Mutations in a gene encoding an ABC transporter;
TITLE OF INVENTION: Pseudoxanthoma Elasticum
FILE REFERENCE: PXE-001PC
CURRENT APPLICATION NUMBER: US/10/764,328

CURRENT FILING DATE: 2004-01-23
                                                                                                                                                                     transporter

Pharmacol. 57:634-641(2000).

-!- FUNCTION: May participate directly in the active transport of drugs into subcellular organelles or influence drug distribution indirectly (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).

-!- TISSUE SPECIFICITY: High in liver and lower in duodenum and
                                                                                                                                                                                                                        Gaps

J. Hum. Genet. 46:699-705(2001).
J. FUNCTION: May participate directly in the active transport of indirectly. Transports glutathione conjugates as Leukotriene-c4 (LTC4) and N-ethylmaleimide S-glutathione (NEM-GS).
J. SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
J. SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
J. SISSUE SPECIFICITY: Expressed in kidney and liver. Very low capression in other tissues.
J. DISEASE: Defects in ABCC6 are a cause of autosomal dominant pseudoxanthoma elasticity of elasticitication of elastic fibers in skin, arteries and loss of elasticity, arterial insufficiency and retinal hemorrhages leading to macular degeneration.
J. DISEASE: Defects in ABCC6 are a cause of autosomal recessive pseudoxanthoma elasticum (AR-PXE) [MIM:264800].
J. SIMILARITY: Belongs to the ABC transporter family. MRP subfamily.
J. SIMILARITY: Belongs to the ABC transporter family. MRP subfamily.
J. CAUTION: Ref. 2 sequence differs from that shown due to erroneous gene model prediction.
J. DATABASE: NAME=Mutations of the ABCC6 gene;

WPI; 2002-691521/74

New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 21; Page 81; 149pp; English.

and (T) The present invention describes an isolated peptide (I) that binds inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). have cytostatic, hepatotropic, antiinflammatory, hypotensive,

or disulphide. At least one building unit is connected via a bridging group to form a cyclic structure with a moiety selected from a second building unit, side chain of or N-terminal amino acid residue. A composition containing the analogue may be used for preventing disorders such as cancers, autoimmune diseases, endocrine disorders, diabeticased complications, gastrointestinal disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-surgical associated complications, gastrointestinal disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-surgical analogue is used for the dispussing cancer. The backbone cyclic analogues can be used for the treatment patients with hormone-secreting and hormone-dependent tumours. They reduce diarrhoea through the inhibition of vasoactive intestinal peptide (VIP) secretion and by direct inhibition of vasoactive intestinal peptide (VIP) secretion and by direct cand 5 receptors may be used for treatment of non-insulin dependent diabetes mellitus. They are useful for the prevention of atherosclerosis and restenosis. The analogues are metabolically stable, selective in their in-vivo activities and safe

The present invention describes backbone cyclised somatostatin analogues

(I) that incorporates at least one building unit containing one nitrogen
atom of the peptide backbone connected to a bridging group (comprising an
amide, thioether, thioester or disulfide) where at least one building
cunit is connected via the bridging group to form a cyclic structure with
a moiety selected from the group consisting of a second building unit,
the side chain of an amino acid residue of the sequence or the N-terminal
cunit and acid residue. (I) has antiarteriosclerotic, immunosuppressive,
cytostatic, antidiabetic, antidialmamatory and analogue cativities, and
can be used as a somatostatin receptor ligand. (I) are useful in the
treatment of atherosclerosis, autoimmune diseases, cancers, diabetic-
associated complications, endocrine disorders, inflammation,
cassociated complications, endocrine disorders, inflammation,
cassociated complications, endocrine disorders, inflammation,
crestenosis. (I) can also be used in the diagnosis of cancer, by imaging
the existence of metastases, it being labeled with a detectable probe.
The present sequence represents a backbone cyclised somatostatin analogue
from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW97452-571 represent antigenic sites derived from the haemagglutinin-
neuraminidase (HN) protein of the paramyxoviridae. The specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GapB

The first (N-terminal) amino acid of the new peptides has D-configuration. The peptides are claimed example of the generically. The present peptide is a specifically claimed example of the generic compounds. The peptides are useful for treating hypertension, metabolic and endocrine disorders, congestive heart failure, myocardial infarction, endotoxic shock, subarachnoid haemorrhage, arrhythmia, asthma, acute and chronic renal failure, preeclampsia, diabetes, neurological disorders, pulmonary hypertension, ischaemic disease, ischaemic bowel disease, gastric mucosal damage, Raynaud's disease, restenosis, percutaneous transluminal coronary angioplasty, angina and cancer. o detect HIV
                                                                                                                                                                                                                                                                                AAW56525-36 represent antigenic Human immunodeficiency virus type 1 (HIV-1) peptides used in the test device of the invention. This test device comprises, in a housing, an absorbent pad, a reagent layer containing immobilised test antigens and a filter. The housing has an opening, adjacent to the filter, for applying an aqueous sample, and the filter is held in contact with the reagent layer by a sleeve. The filter protrudes from the sleeve such that it exerts a greater pressure on the reagent layer than does the sleeve. The device is specifically used to detect HIV infection from presence of specific antibodies in whole blood, but many other analytes can also be detected, e.g. amino acids, nucleic acid, hormones, vitamins, microbial pathogens and drugs (therapeutic or

                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of identifying a ligand that can mediate the biological activity of target protein via inhibition of the binding of target protein to a binding partner ligand comprising screening first combinatorial library having first member ligands for binding to target protein to identify target-binding ligand(s). The method is useful for identifying ligands that can mediate the biological activity of target proteins via inhibition of the binding of target protein to a binding partner ligand. The invention does not require that the natural binding partner be used as reagent. The need for the natural binding partner is obviated with the use of complementary combinatorial libraries. The present sequence is used in the exemplification of the

                                                                                                  The present invention describes a composition (I) comprising an amino acid human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in a group-based vaccine any be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 invention. (Updated on 11-SEP-2003 to standardise OS field)

The present invention describes a composition (I) comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

membrane immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABI25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines compositions. There is evidence that the immune response to whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen, antigens are selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of the group-based vaccine approach is the ability to additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPI1501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)

(HIV-1)

Vaccine compositions comprising human immunodeficiency virus-1

```
The present invention describes a composition (1) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (1) has virucide activity and can be used in vaccines. (1) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines. Compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, an group-based vaccine may be selected from conserved regions of viral or an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPI1501 to ABP25412.

Tepresent peptide sequences used in the exemplification of the present invention. (Updated on 11-SBP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunodeficiency virus; env; pol; gag; nef; vpr; vpu; c T lymphocyte; CTL; immune response; epitope; antigen; tion; immunisation; virucide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð
                                      The present invention describes a composition (I) comprising an prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

the present invention describes a composition (1) comprising an amino acid chuman immunodeficiency virus-1 (HIV-1) group comprising an amino acid chuman immunodeficiency virus-1 (HIV-1) group comprising an amino acid chuman immunodeficiency virus-1 (HIV-1) group comprising an amino acid chuman immunodeficiency virus-1 (HIV-1) group compositions. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of can group-based vaccine approach is the ability to additional advantage of an group-based vaccine approach is the ability to additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)

glucuronosyltransferase (EC 2.4.1.17), hepatic - rat (fragment)

Sjucuronosyltransferase (EC 2.4.1.17), hepatic - rat (fragment)

N;Alternate names: UDP-glucuronyltransferase
C;Species: Rattus norvegicus (Norway rat)
C;Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 07-Feb-1997
C;Accession: PX0008
R;Yokota, H.; Yuasa, A.; Sato, R.
J. Biochem. 104, 531-536, 1988
A;Title: Purification and properties of a form of UDP-glucuronyltransferase
A;Reference number: PX0008; MUID: 89197852; PMID: 3149280
A;Reference number: PX0008
A;Accession: PX0008
A;Molecule type: protein
A;Residues: 1-7 <YOK>
C;Keywords: glycosyltransferase; hexosyltransferase; liver

"Isolation, primary structure and synthesis of two neulatoract brochae maderae: members of a new family of Cephalc Comp. Biochem. Physiol. 84C:205-211(1986).

-!- FUNCTION: This cephalomyotropic peptide stimulateractivity of cockroach protodeum (hindgut).

-!- SUBCELLULAR LOCATION: Secreted.
Amidation; Direct protein sequencing; Neuropeptide.
Amidation; Direct protein sequencing; Neuropeptide.
MOD RES
8 8 Glycine amide.
SEQUENCE 8 AA; 893 MW; DC6365B449CDC76A CRC64;
                                                                 Biochem, Biophys. Res. Commun. 155:332-337(1988).
-1- FUNCTION: Inhibits angiotensin-converting enzyme.
PIR; A31570; A31570.
Direct protein sequencing; Metalloprotease inhibitor.
SEQUENCE 8 AA; 953 MW; 6AA863733051F1B7 CRC64;
